It is clear that gasoline and oil are critical resources for our country. Moving to electrical vehicles is a whim without a structured organized agenda to implement these vehicles. The national grid is not capable of accommodating the levels of energy requirement. Time is necessary to build out the support structures to make an electric vehicle practical. This is not happening yet. The policy to implement is moving ahead. Voters should have an opportunity to say whether they approve or disapprove of this mechanism. Referendum's are required.
