Comments:

Delaware is not California and should not be adopting anything from California. The state should not be telling citizens and manufacturers what they can or can't buy or make. Electric vehicles are NOT good for the environment, just for elites who make money and get taxpayer credits and the CCP who control many minerals for the batteries. EVs are environmentally worse in their manufacture and later disposal than gas powered vehicles. Electric vehicle are DANGEROUS--they can catch on fire and destroy property and people. They are inefficient as they have limited range, which goes down with time alone, but also with bad weather. They are DANGEROUS because they can strand people who are trying to escape dangerous storms or by blocking roads by becoming majorly heavy paperweights. They also make going any distance difficult and time-consuming. The weight of them will ruin roads and could collapse parking garages. And of course they are majorly expensive to buy, expensive to charge, and outrageously expensive to replace batteries, which can't be recycled. Oh, and EVs are STILL powered almost entirely by FOSSIL FUELS and always will be. Gas vehicles are affordable, refuel in minutes, have longer distance ranges and can carry more than a few people and baggage. They also are preferred by the vast majority of people, including the citizens of Delaware. Stop trying to force people to sit down, shut up and do what we are told by power-hungry elitists in the name of so-called climate change (which was global cooling before it became global warming before it became climate change--something that exists only in computer models and not in reality.)
