To whom it may concern:

I have solar panels on my home, so do not take this as I am anti-green, but the technologies and infrastructure existing will not be ready to power a country of 330,000,000+ people and the industries contained within anytime soon. Additionally, "Green Energy" systems have many ugly sides detrimental to the environment and wildlife as well, which all need to be realistically addressed as we move forward.

We should be embracing the concept of being "power agnostic". Where and when new green energy systems work, use them, but, have the courage to accept the limitations existing and understand the folly of mandating policies prematurely. This will only result in diminishing the quality of life for the entire population, while reducing the standard of life for all Americans. In 10, 25 or 50 years perhaps, but currently, this push to green will end in a bad way for America.

Here is the core message, there are groups who engage in pushing a diminished lifestyle for all so they achieve their desire green goal. We see this onslaught daily, and it must be addressed realistically, not only by the emotionally driven, pseudo-scientific or politically motivated, but by the wants, needs and concerns of the entire country.

There currently are so many self-inflicted stress points in American life today and for some reason we continue to pile these onto our stressed out citizens.

Please reconsider some of these proposed "Low Emission Vehicle Program" policies on the drawing board and extend realistic timeframes for achieving goals when the technology is advanced enough to get the job done... we are not anywhere near that point yet and will not be for years.

Thank you
