Comments:

The science regarding climate change is far from settled. The world's top climate scientists who have dedicated their lives researching this issue state emphatically that this debate is far from over. Before our legislators draft any laws regarding this issue, they should read the book entitled, "Hot Talk, Cold Science," written by three of the world's top climate scientists and endorsed by hundreds more around the world. This informative book will prove that science doesn't lie. Here are a few facts I have learned from this publication: 1. Since 1979, global temperatures have increased by 1/10th of a degree Celsius per decade up to the present time; 2. For the past several centuries, sea levels are rising 1-2 mm per year. At this rate sea level will be only 6 inches higher by the year 2100; 3. Since the year 2000, there has been little, if any, warming caused by greenhouse gases. Sadly, none of these science-based facts appear in the climate activist's playbook. One of the authors of the above-referenced book is David Legates, a professor of climatology at the University of Delaware! Mr. Legates should be invited to play a major role in determining Delaware's direction in all climate-related issues and should be invited to attend and speak at every meeting this State has on all climate-related issues.
