Comments:

The American people should have a choice in picking what they want in a vehicle whether it would be electric, gas or diesel. Electric cars will not work for several reasons. The electric infrastructure is nowhere ready! It will cause overload on the electric causing outages, reduced use etc for all the other needs for electricity. The technology for the electric cars is not ready for what is being proposed. It takes hours to charge and it has to be done frequently. More tires will be needed as the electric cars are heavier and will use them up quicker. What happens when new batteries are needed? What will the cost be? How often and what will be done with the old batteries? How are cars going to be charged? There are nowhere enough charging stations. Electricians will not be available to install chargers in private homes because they are busy with all the new charging stations. What will the homeowner have to pay to install the charging station for their house? In short, this push for electric cars won't work. The infrastructure can't handle it, the homeowner can't afford to buy new cars, the homeowner can't afford to maintain these cars and the government should not limit our choices. This is also going to affect the movement of goods needed for everyday life! This is BS!!!
