

Comments regarding US Wind's Cable Landing on 3Rs Beach

DNREC,

You have the ability to protect our coast and your residents. We have examples of Offshore Wind Cable Landing construction and resulting issues to our North and to our South. What we are witnessing in real time is nothing like the pretty posters US Wind has presented. What we are witnessing in real time are the hazards of offshore wind industrialization. As you are well aware, BOEM even recognized that there is no positive affect on the environment from these project. In fact, what we are witnessing is the massive destruction of our environment.

Why, when you have the ability to know and see the truth first hand, won't you? Why does this project need to be rushed through instead of carefully thought out? It is incumbent upon you to protect the State, its environment and its residents. Do not approve this project, there are no benefits, most especially to Delaware.

There are other places to land those cables, choosing one of the most fragile environments is simply poor stewardship. Below are a few examples of the issues other projects are having. All projects follow the same game plan.

Ballastable Speaks - Protect Our Beaches & Drinking Water
 April 10-13
 Construction photos of the Vineyard Wind project at Cowles Beach, Cotuit, MA.

This was a collaborative effort. It's a huge project that requires 24 hours a day, 7 days a week. It's not just about the pipes and the gravel, it's about the people who are working on it. The sand is not just sand, it's our future. We're working to protect it and make sure it's there for everyone.
