Comments:

notes that I need to add to prior contact What if there's a 1.snowstorm and they can't get into pump the tanks out 2. what if there's a flood and the tanks overflow. 3. when I have my tank cleaned out, it takes the guy 45 minutes to an hour for 1 1500 gallon tank 2 compartments . 15 tanks add that time up11.25 hours there's no way that that could be done every other day by a company. It would take up two trucks and four men to be able to do that job just for, that property that is absurd those tanks are not connected together other than overflowing into each other meaning that you can't just put a hose into one tank and empty all the tanks. Every tank has to be emptied individually and there's two compartments in each tank. 4.would you want a stinky 18 wheeler driving into your neighborhood every 2days 5. I don't think an 18 wheeler would fit down through that neighborhood anyway especially if there were cars on the street. This is a Band-Aid on a cut that is bleeding badly and needs 20 stitches and major surgery. It just doesn't work. They're only option can be a pumping station and that is it. They need to just wait it out until the pumping station is approved and installed.
