**Subject:** Data Centers in Delaware

**Follow Up Flag:** Follow up  
**Flag Status:** Flagged

Delaware does not have the power infrastructure to support these giant data centers. We buy all (or most of) our energy from other states. Are we the poor neighbor who ends up with all the industrial crap in our tiny state? Does our quality of life not matter? This AI they are pushing is nothing more than a money grab by billionaires who could care less about our quality of life or our wildlife. We are a major stop on migratory bird pathways. Route 9 is basically a wetland. Don't tell me that once they get their foot in the door that this creeping monopoly will stop with what they've won from us. They will be "now we need to build another million square foot building to keep up with demand"; "we now need to access Red Lion Creek to help keep our precious data cool"; "now we need to spill millions of gallons of tainted water into the Delaware Bay".... It will never end, what they "need" from us. Never what is good for Delaware. Never what is good for the environment. We wanted a paperless society, that is what computers promised us. A cleaner environment. Not this. Not these giant warehouses full of A.I. slop, online gambling, porn,... whatever is the new vice that they are exploiting to make money. People used to be on the top of the food chain. Now giant warehouses of data are more important than people. If they want our land and our resources, that should come with an extremely high price for large corporations. A price so high that they will look elsewhere. We are not a dumping ground. People and wildlife should come first. Always.
