1. Prior to moving to electric vehicles, what is the plan to enhance our electric grid to handle the charging stations and demand for more electricity?
2. The batteries are incredibly large and heavy. What is the plan for disposal of spent batteries? How will this impact our environment?
3. Have you calculated the additional electrical supply needed to power and charge all the additional vehicles? How many years will it take to get there?
4. Will the batteries be made here in the United States, or are we going to be dependent upon China?
5. What scientific studies have been done to show that it is more cost effective to power a car with electricity or with gas? How does this impact the distance you can travel on one charge vs. x gallons of gas?

It would be really great to have answers to these questions.
