Hello,

Just writing to bring up some things that may have been overlooked when thinking of these regulations.

Thanks

-Evron

### ***Protecting Consumers***

1. Most electric cars require that owners take the vehicle back to a service center owned/operated by them. This in turn creates an environment on which they can charge whatever. A similar example would be Apple (iPhone's) requiring you to take your device back to them for repair so all features stay functional.
2. Many of these electric cars have cameras/gps/monitoring modules where users have no choice to opt out of being tracked. This data is likely being sold for profit by these car manufactures without user consent.
3. Some car manufacturers (Tesla/BMW) are starting to adopt a "subscription model" for things that used to come standard with a car. This should is another cost that may be passed on to consumers.
