To: Krall, Kyle (DNREC) <Kyle.Krall@delaware.gov>

We cannot afford to switch to EV cars because our grid is not capable of handling it. we already have rolling blackouts , we already are asked to reduce our air conditioning level and our heating level . so how do you intend for us to be able to even afford these cars let alone replace any batteries ? and speaking of the batteries how are we to dispose of these batteries that are very expensive and require minerals that we cannot produce! And nobody has mentioned the cost of powering up the battery? How are people who live in apartment high risers to power their cars?
It is worse for the environment than using gas and diesel. I respectfully ask you to consider NOT following California!!
