To: Krall, Kyle (DNREC) <Kyle.Krall@delaware.gov>

Mr. Krall,

Luckily we are not the first adopters of this Proposal.

We have seen that:

1. EV cars are not sustainable from the grid's stand point. Since America moves by car, this would cripple our state.
2. EV cars derive the electricity to charge them from somewhere. Where might that be? Local fossil fuel plants or Nuclear plants. Therefore you are not saving anything
3. The batteries that the EV's use come from China. Aren't we crippled enough relying on foreign countries (especially those that do not like us) for our energy?
4. Once the batteries go bad (around 10 years) they are very expensive to replace AND are horrible for the environment
5. Manufacturing and mining for the materials to make the batteries take a tremendous toll on the environment

My thoughts: Let's work on all forms of energy especially truly renewable energy like hydrogen and in the meantime not cripple our economy and national safety!
