To: Krall, Kyle (DNREC) < Kyle.Krall@delaware.gov>

I haven't heard about this meeting but I can really imagine what was said about todays vehicles that are powered by gasoline.

My 2 cents of opinion is that the DuPont company solved the issue of replacing gasoline powered engines in 1973 with the

development of a powerful rotary engine that used two non-combustible chemicals that interacted to produce the energy for

a rotary style turbine, then were internally separated for reuse. I believe the inventor was Dr. Max Bechthold (?)

it was announced on TV, with the result that the Big Four auto companies (now reduced to the trembling two) called the DuPont HQ and threatened to run the DuPont company out of business if it sold or manufactured it. My wife was the group

secretary for Max, and has a better idea of what was the final result. Alas, aleck what might have been! W. Cawthray.

P.S.--- It only needed a little heat source to start the reaction.
