To: Krall, Kyle (DNREC) <Kyle.Krall@delaware.gov>

Dear Mr. Krall,

I am contacting you to voice my outrage and confusion as to how you or anyone can support all EV by 2035. Do you realize that this state along with the country does not have the capability to support EV? Electricity to support the charging stations is generated by fossil fuels. Are you aware that Switzerland is putting a restrictions on charging EV's because the country needs the electricity to heat the country.

No one has done their homework into looking into the feasibility of converting all vehicles from gas to EV. How can an average person purchase or afford one of these vehicles or pay for repairs? And, what would you do with all of the present gas powered vehicles?

The world is not equipped to convert to EV. It is an unrealistic dream. Besides, do we really want to support China? The administration will not let the US mine the minerals we need for the batteries etc.

Do you want to sit for an hour(s) to charge a vehicle that can only operate for the most 300 miles or do you want to wait only 10 minutes to fill you gas tank?

Politicians need a reality check. Have you read or heard of the nightmare car trips where it takes forever? In this fast paced world who will have the patience to sit and wait while the car charges?

Politicians and politics needs to enter into the real world and not the world of the elites.

Penney Herrel-McCormick
