HSCA Screening Level Table

January 1, 2013

Last Updated April 2021

The screening levels listed in the Hazardous Substance Cleanup Act (HSCA) Screening Level Table in Appendix A should be used for screening purposes only for the protection of human health and the environment. The screening levels are not to be construed as site specific clean up levels. The HSCA Screening Level Table combines background, risk-based and regulatory values in soil, groundwater, soil gas, sediment and surface water. The screening levels should be used to determine the contaminants of potential concern (COPCs) in the risk assessment process. Any laboratory confirmed analyte concentration exceeding the HSCA Screening Level Table values may require further evaluation. These screening levels should be used in lieu of the URS values and the values established in the 2007 Policy Concerning the Default Background Concentration of Arsenic and Revision to the Remediation Standards Guidance for all new sites (as of January 1, 2013) regulated under the Hazardous Substance Cleanup Act (HSCA) and for existing sites where a risk assessment has not yet been performed.

The screening levels for soil are primarily based on the United States Environmental Protection Agency (EPA) Regional Screening Levels (RSLs) for residential soil, with several exceptions. Soil background threshold values (BTVs) were calculated based on samples from Delaware background studies. For more information about these studies, please refer to the following documents: *Statewide Soil Background Study: Report of Findings* (DNREC, 2012), *Report of Findings – PAH Background Study – New Castle, Kent, and Sussex Counties, Delaware* (EA Engineering, 2014), and *PAH Background Study and Calculation of Background Threshold Values – New Castle, Kent, and Sussex Counties, Delaware* (EA Engineering, 2016).

Unlike the URS values, there is now only one screening level per analyte for soil. Therefore, soil sample results should be compared to the soil screening level for the particular chemical analyzed regardless of the current or future land use or whether the sample was collected in a Critical Water Resource Area or Non-Critical Water Resource Area. If a hazardous substance exceeds the screening level, it is generally retained as a COPC.

The screening levels for groundwater are primarily based on the EPA RSLs for tapwater. When the EPA RSL for tapwater exceeds the Delaware or Federal Maximum Contaminant Level (MCL) for drinking water, then the MCL replaces the RSL as the screening level.

Screening levels for groundwater to indoor air were added to the HSCA screening level table in January 2015. Groundwater values should be screened for the groundwater to indoor air pathway by comparing the groundwater result to the screening table. Results that exceed the groundwater screening value should be carried to the next step in the risk assessment process. For some compounds, the groundwater value that presents a risk for groundwater to indoor air is lower than the groundwater ingestion pathway values. These screening levels were generated by using the EPA Vapor Intrusion Screening Level (VISL) Calculator.

Screening levels for sub-slab and external soil gas were added to the HSCA screening level table in January 2014. These levels were derived from the EPA resident air RSLs by multiplying by the inverse of the USEPA attenuation factor from indoor air to sub-slab air (33). The majority of the screening levels are from IRIS and EPA Provisional Peer Reviewed Toxicity Values. USEPA Vapor Intrusion Screening Level Calculator may also be used to calculate a screening level of $TR = 1E-06$ and $THQ = 0.1$. The calculator may be downloaded from

<https://www.epa.gov/vaporintrusion/vapor-intrusion-screening-levels-visls>. Soil gas or sub-slab results that exceed the screening levels should be evaluated with VISL at TR = 1E-05 and THQ = 1 or the Johnson-Ettinger Model (with updated toxicity values) using site specific data.

Screening levels for ecological sediment, surface water, and soil were added to the HSCA screening level table in January 2014. The sediment and surface water screening levels represent both freshwater and marine environments, and they were derived from the [EPA Region III BTAG Screening Benchmarks](#) for sediment and surface water, with several exceptions. Where the EPA Screening Benchmarks exceeds the [Delaware Surface Water Quality Criteria for the Protection of Aquatic Life](#), then the Delaware Surface Water Quality Standard replaces the EPA Screening Benchmark as the screening level. “Freshwater” means the salinity is less than 1 part per thousand; “marine water” means the salinity is greater than 10 parts per thousand. If a surface water sample has a salinity measurement between 1 – 10 parts per thousand, use the lower of the two screening values. The soil screening levels were mostly derived from [RAIS](#); however, some levels were derived from the [NOAA Screening Quick Reference Tables](#).

Screening levels may be at concentrations that are below the routine laboratory method detection limit (MDL). When the HSCA-approved laboratory is unable to detect concentrations as low as the screening level and the MDL exceeds the screening level, the routine MDL for the laboratory shall become the screening level and analytes will be considered COPCs if they exceed the MDL (i.e., if detected, the analyte is a COPC). In some instances, DNREC may require that the best available technology (i.e., a different analytic method) be used to achieve a lower MDL based on site-specific conditions.

The HSCA Screening Level Table will be updated as significant changes occur, and the updated table will be available on the [DNREC webpage](#). Analytes may be added or deleted from the table. Therefore, please ensure that you are using the most current version of the HSCA Screening Level Table, available in Appendix A and on the DNREC webpage. The analytes with concentrations that have been updated between the previous version and the current version of the Screening Level Table will be indicated. The effective date of the most recent revision will be listed in the heading of the table.

A special note regarding Endosulfan (115-29-7): Please sum Endosulfan I and Endosulfan II analytical results and compare the sum to the screening level for Endosulfan.

Chlorinated dibenzo-p-dioxins, chlorinated dibenzofurans, and dioxin-like polychlorinated biphenyls (PCBs) are similar to 2,3,7,8-TCDD but vary in degree of toxicity, with 2,3,7,8-TCDD considered the most toxic. For these dioxin-like compounds, a toxicity equivalence factor (TEF) should be applied to adjust the concentrations to a 2,3,7,8-TCDD toxicity equivalent (TEQ) concentration. Then, the total TEQ should be compared to the screening level for 2,3,7,8-TCDD. The 2005 World Health Organization (WHO) TEFs for dioxins, furans, and dioxin-like PCBs are listed in the table below. For more information, please refer to the May 2013 EPA factsheet, "[Use of Dioxin TEFs in Calculating Dioxin TEQs at CERCLA and RCRA Sites \(PDF\)](#)" and the [EPA RSL User Guide](#).

Appendix A
HSCA Screening Level Table

Changes to the HSCA Screening Level Table in April 2021:

- The following analytes had changes in name and/or CAS No. due to changes in the EPA Regional Screening Level table (with TR = 1E-06 and THQ = 0.1) from May 2020 and November 2020:
 - Chlordane was changed to Chlordane (technical mixture) with CAS No. 12789-03-6.
 - Dichloroethylene, 1,2-cis- was slightly changed to dichloroethylene, cis-1,2- (CAS No. 156-59-2).
 - Dichloroethylene, 1,2-trans- was slightly changed to dichloroethylene, trans-1,2- (CAS No. 156-60-5).
 - Diquat was given the CAS No. 2764-72-9 (previously 85-00-7).
 - Glycidyl was changed to glycidaldehyde with CAS No. 765-34-4.
 - Mephos oxide was changed to tribufos with CAS No. 78-48-8.
 - Polybrominated biphenyls were given the CAS No. 36355-01-8.
- The following analytes were newly added due to changes to the EPA Regional Screening Level table (with TR = 1E-06 and THQ = 0.1) from May 2020 and November 2020:

<u>Analyte</u>	<u>CAS No.</u>
Ammonium Picrate	131-74-8
Hexamethylene diisocyanate biuret	4035-89-6
Hexamethylene diisocyanate isocyanurate	3779-63-3
Hexane, Commercial	E5241997
Pentamethylphosphoramide (PMPA)	10159-46-3
Tetramethylphosphoramide, -N,N,N',N" (TMPA)	16853-36-4

- The following analytes had soil screening levels that changed due to changes in the EPA Regional Screening Level table (with TR = 1E-06 and THQ = 0.1) from May 2020 and November 2020. Both the old and new concentrations are listed below:

7. The following analytes had sub-slab and soil gas screening levels that changed due to changes in the resident air values in the EPA Regional Screening Level table (with TR = 1E-06 and THQ = 0.1) in November 2020. There were no changes based on the May 2020 RSL update. Both the old and new concentrations are listed below:

<u>Analyte</u>	<u>CAS No.</u>	<u>Old Conc. (ug/m3)</u>	<u>New Conc. (ug/m3)</u>
Chlorobenzotrifluoride, 4-	98-56-6	1000	11
Dichloroethylene, trans-1,2-	156-60-5	--	140

8. The Toxicity Equivalence Factors (TEFs) for PCB 170 (35065-30-6) and PCB 180 (35065-29-3) were removed since these TEFs were withdrawn during the World Health

Organization European Centre for Environment and Health/International Programme on Chemical Safety (WHO-ECEH/IPCS) TEF re-evaluation in 1997.

The screening level table is arranged in the following manner:

1. Analyte is indicated in column 1.
2. Chemical Abstracts Service (CAS) registry number corresponding to the analyte is indicated in column 2. If a CAS number is not available for an analyte, another identifier may be indicated in this column for administrative purposes only.
3. Whether the analyte is carcinogenic or non-carcinogenic is indicated in column 3.
4. Whether the analyte is volatile is indicated in column 4.
5. If analyte is part of EPA's Target Analyte List (TAL) or Target Compound List (TCL), 'TAL' or 'TCL' is indicated in column 5.
6. Screening level for soil is indicated in milligrams per kilogram (mg/kg) in column 6.
7. Key describing how soil screening level was derived is included in column 7.
8. Screening level for groundwater (ingestion) is indicated in micrograms per liter (ug/l) in column 8.
9. Key describing how groundwater (ingestion) screening level was derived is included in column 9.
10. Screening level for groundwater (VI) is indicated in micrograms per liter (ug/l) in column 10.
11. Screening level for sub-slab and external soil gas samples in micrograms per cubic meter (ug/m³) in column 11.
12. Screening level for ecological fresh-water sediment is indicated in milligrams per kilogram (mg/kg) in column 12.
13. Screening level for ecological fresh-water surface water is indicated in micrograms per liter (ug/l) in column 13.
14. Screening level for ecological salt-water sediment is indicated in milligrams per kilogram (mg/kg) in column 14.
15. Screening level for ecological salt-water surface water is indicated in micrograms per liter (ug/l) in column 15.
16. Screening level for ecological surface soil is indicated in milligrams per kilogram (mg/kg) in column 16.

The keys, which describe how the screening levels were derived, are defined as follows:

RSL	EPA Regional Screening Level from November 2020 (with TR= 1E-06 and THQ= 0.1);
BTV	Background Threshold Value was calculated based on samples from Delaware background studies. For soil: The concentration is either a 95% Upper Tolerance Limit (UTL) with 95% coverage (for metals), which represents the value below which 95% of the population values are expected to fall with 95% confidence, or a 95% Upper Simultaneous Limit (USL) (for PAHs) with the exception of Arsenic. Arsenic's background concentration was established previously.

HSCA SCREENING LEVEL TABLE – LAST UPDATED APRIL 2021

MAG	Massachusetts guidance for petroleum hydrocarbons was adopted as the screening level;
MAX	Maximum ceiling value was adopted as the screening level;
MCL	Delaware or Federal Maximum Contaminant Level;
PQL	Practical Quantitation Level was adopted as the screening level;
HAL	EPA's Lifetime Health Advisory Level (May 2016) was adopted as the screening level. When both PFOS and PFOA are detected in groundwater, the combined concentrations of PFOS and PFOA should be compared to the Health Advisory Level;
EPAR4	EPA Region 4 Residential Soil Screening Level (Nov. 2009) was adopted as the screening level;
PYR	EPA RSL for Pyrene was adopted as the screening level for Phenanthrene, although Phenanthrene is not included within the EPA RSL table;
DRO	DNREC Tier 0 action level for TPH-DRO was adopted as the screening level;
GRO	DNREC Tier 0 action level for TPH-GRO was adopted as the screening level;
=	Data from 7 DE Admin Code 7401 Surface Water Quality Standards Regulations - Table 1: Water Quality Criteria for Protection of Aquatic Life.
==	Data from NOAA Screening Quick Reference Tables (http://response.restoration.noaa.gov/sites/default/files/SQuiRTs.pdf)
ug/l	micrograms per liter;
ug/m ³	micrograms per cubic meter;
mg/kg	milligrams per kilogram;
TAL	EPA Target Analyte List for Metals and Cyanide;
TCL	EPA Target Compound List for Volatile Compounds, Semivolatile Compounds, and Pesticides/Aroclors;
c	carcinogenic;
n	non-carcinogenic;
---	No soil or groundwater screening level is available; OR No identified vapor intrusion risk because the chemical is either not volatile or inhalation toxicity information is not available; OR No ecological risk because the chemical is either not a risk or no data is available.
