

DELAWARE'S EMISSIONS TODAY

DELAWARE'S CLIMATE ACTION PLAN

Delaware tracks greenhouse gas emissions through an annual “inventory” of emissions. The information for the inventory comes from a variety of sources like fuel sales, industrial emissions reporting and electricity uses. The inventory reports emissions that occur within our state, but also includes the emissions from electricity imported into the state. Because it takes time to get the data and to ensure the accuracy of the data, the inventory is several years behind. The most recent inventory available is from 2021.
