## Used oil overfill prevention:

- First determine how many gallons (inches) of oil will fill the UST $90 \%$. For example, if you have a 550 -gallon UST, 495 gallons is the maximum amount of oil you should add to it before having it pumped out.
- This level must be compared to the level that can be contained in the UST without exceeding $90 \%$ of its capacity;
- All pump-out receipts must be saved and must show the amount of Used Oil removed, the date, and the name and address of the company performing the pump-out.
